Mini guide at the bottom

2

2. Build Area

<body> your page starts here

<h1> Big title

<p> Paragraph

 bold

3

3. Live Preview

My website

This is my first website.

Made by me.

What will you make?

1. Block Library

Choose blocks to add HTML or CSS.

2. Build Area

Arrange blocks and type your content.

3. Live Preview

See the web page update as you work.

Top buttons: **Help!** opens this PDF, **Import HTML** loads an existing web page, **Export CSS** downloads just the stylesheet, and **Download page** saves the whole website as one HTML file.

How to build with HTML

HTML is the **structure** of your web page. Think of it as the pieces that go on the page.

1. Add a block

Click a block in the library (or drag it) to put it on your page. Start with a heading or paragraph.

2. Fill in the boxes

Type your text, link, or image URL into the fields inside the block.

3. Build inside bigger blocks

Paragraphs can hold smaller text blocks like bold, italic, underline, and links.

4. Check the preview

Look to the right to see what your site looks like in a browser.

Common HTML blocks

`<h1>` = main title

`<p>` = paragraph of text

`<a>` = clickable link

`<img>` = image

Simple page idea

```
<h1>My Favorite Movie</h1>
<p>It is exciting and funny.</p>
<a>Watch trailer</a>
```

At the bottom of the HTML block library, there is now a “**How to? HTML**” box with a quick reminder built right into the app.

How to style with CSS

CSS changes how the page **looks**: colors, fonts, spacing, borders, and more.

Important: CSS starts **OFF** by default in HTMeatbaL. Turn the CSS switch **on** before you expect your styles to appear in the preview.

1. Click the CSS tab

Switch from HTML to CSS in the editor header.

2. Turn CSS on

Use the switch near the top of the editor so your styles appear in the preview.

3. Choose what to style

A selector picks the thing you want to change, like `body`, `h1`, or `a`.

4. Add properties

Properties change the look, such as color, background, font-size, and padding.

Easy CSS examples	What they do
<code>body { background: lightblue; }</code>	Changes the page background color.
<code>h1 { color: purple; }</code>	Makes all big headings purple.
<code>p { font-size: 20px; }</code>	Makes paragraph text bigger.

At the bottom of the CSS block library, there is now a “**How to? CSS**” box with quick reminders and an example rule.

Importing, exporting, and turning work in

Help!	Opens this PDF. If you replace the repository's howto.pdf, the button automatically points to the new version.
Import HTML	Loads an existing HTML file into HTMeatbaL so you can keep editing it.
Export CSS	Downloads only your CSS as my-styles.css.
Download page	Downloads the whole website as a single HTML file.

Suggested classroom workflow

1. Build the page in HTML.
2. Add styles in CSS and turn CSS on.
3. Import older HTML files if you need to continue yesterday's work.
4. When finished, use **Download page** (and **Export CSS** if your teacher asks for the stylesheet separately).

Tip: Good boys close their tags. Example: `<p>Hello</p>`
